Background Information

Discovery Information

Build and Update process on Android and iOS:
- We can automate the build creation process for IOS and Android and publish for internal testers (testflight and app testers)
- Retrieve information around status of build

- We cannot publish and unpublish the application via the admin portal
- We cannot push to public stores
- We cannot capture and push assets for marketing the application in the app stores via the dashboard
- We cannot delete mobile applications via any automation.

Build information for customer:

Branded mobile app at your event

Mobile app asset & specification guide

Summary

Reduce time spend managing mobile applications by:
-Storing build and version update config attributes in the Admin Portal.
-Facilitating the create of builds and the publishing of builds via the App Store (Tbc)
-Facilitating the unpublishing of builds from the App stores

Assumptions

We can automate as the build, update and publish process via the Admin Portal

Timeline

March 2026

User Personas

- Event Organiser
- Grip Ops Team
- Grip Engineering and Product Team

Functional Requirements

Version 1

Requirements

Technical working: https://drive.google.com/file/d/1qHeKexrnKgsFQtdJYjAE7dfp0ZzhyA0d/view?usp=sharing

Mock ups:
https://app.eraser.io/workspace/tw7RC8CcLggUMUEPxN4K
Angular stepper:
Angular Material

Notes:
Warnings: Google Play and Apple console dependeices

Requirement	User Story	Related Tickets	Notes
Build Inputs: Basic Info	**Insert:** *all fields are mandatory • Icon Display Name *Tool Tip:* *Max 12 characters including spaces. This is the name that will be displayed underneath the app icon on a user's device Home screen. This is the name that you would search for on your phone if trying to find the app.* • App Icon *Tool Tip: PNG, 1024 x 1024 px* • Google Play App Icon: Adaptive Icon *Tool Tip:* *1024 x 1024 px* *Note these appear rounded*		Adaptive icon: • Size: **1024x1024px** • Place your logo/icon in the **center 66%** (safe zone ~676x676px) • Leave the outer edges empty or with a simple pattern - they get clipped • Use a **transparent background** (the `backgroundColor` handles the background Android requires **adaptive icons** for proper circular display
Build Inputs: Apple (Step 2.1)	**Dependency:** App developer and connect granted App store connect inputs generated **Insert:** *all fields are mandatory • ***App Store App Name*** *Tool Tip:* *An app name can be up to 30 characters long including spaces. This is what people will see*		API key security? Masking is complex This page won't be accessed by implementation partner it is Super Admin only

in the Play/App Store (not what is displayed once downloaded to your phone).

- ***Apple Bundle ID***
  Tool Tip:
  Create the ID for the app in this format (e.g. com.xxx.app)
- ***Apple Team ID***
  Tool Tip:
  Source in Apple Developer Portal
- ***Apple Key name***
  Tool Tip:
  Source from App Store connect
- **Apple Issuer ID**
  Tool Tip:
  Source from App Store connect
- ***Apple Key ID***
  Tool Tip:
  Source from App Store connect

Upload only:
*you can only add these files once team_Id are added
*mandatory

- **Upload API Key file**
  Tool Tip:
  Source from App Store connect
- **Upload APN key file**
  Tool Tip:
  Source from App Store connect

ACTIONS: IF the build fails prompt

- **Clear certificates**
  Tool tip:
  This should be done if the build fails based on certs
- **Clear provisioning profiles**
  Tool tip:
  This should be done if the build fails based on provisioning

---

Read only: (generated when step 2 saved)

- **Apple Store Connect ID**
  Tool Tip:
  Generated once this Step is saved. This field is required for branch.

	• **Game Center Disabled Warning Message** {displayed is GameCentre setting is disabled} *"Build will fail as 'Game Centre' is disabled in Apple Developer portal. Amend settings in Apple Developer portal in order to proceed with build"* *Tool Tip:* *Generated once this Step is saved.*		
Build Inputs: Google (Step 2.2)	**Dependency:** App has been created on Google Play Console **Insert (cannot edit)** - **Google Package ID** *Tool Tip:* *Source in Google Play Console once App created*		**Information created in Google Play Console** Google Play API key: *upload file* -Google Key Name **read: visible once API key generated* -Google Play ID?? (displayed once build created - required for branch) -Google Services - iOS -Google Service - Android -Android Keystore File -Android Keystore password -Android Key alias -Android Key password
Build Inputs: Firebase (Step 2.2)	**Dependency:** Create Firebase project for the App (does support own this??) **Create and edit:** • **Firebase App ID** *Tool tip:* *Sourced from Firebase Project* • **Firebase App Tester emails** {Insert multiple emails} - for product and engineering testing only		
Create Builds: iOS and Android (Plus Android APK download)	As a Grip Admin I want to create an iOS and an Android build So that this can be pushed to the Apple and Google App stores for submission Given that steps 1 and 2 are complete Then i can: - **Create iOS build and push to TestFlight** - **Create Android build and push to App Tester**		**create and submit action in one go?**

	AND - **Download Android build APK file** (confirmation of download started and success)		
Update Build	Same as steps 1,2 and 3 **Scenario 1:** Version update with no changes required just new code version - click upgrade **Scenario 2:** Version update with asset changes name or icon changes - step 1 plus upgrade **Scenario 3:** Firebase testers - amend tester - step3 plus uggrade **Scenario 4:** Customer has made a manual change in the apple stores invalidating ID's - attempting to build, will generate error. I can edit the following if needed: apple key id apple issues app team id upload api key push cert invalidated certs and provisioning profiles *package and bundle ID are ALWAYS locked		Same as steps 1,2 and 3?
Un-publish Builds	**New way of working:** Based on event app end date > typically 30 days unless otherwise Automatically unpublish application		
App Store Submission	Submit app View status: approved		
View all builds	Table View of Builds:		
~~**App Management:** Add additional branch fields~~	~~As a Grip Admin~~ ~~I want to add additional Branch information~~ ~~So that deep linking can be support in the app build.~~ ~~Admin Portal > Branch Details~~ •		~~**Insert:**~~ • ~~**Branch link domain**~~ ~~Igor is saying this is updated from bitrise, but is bitrise connecting directly with branch?? Otherwise we need to store this in dash~~ • ~~**Branch link alternate**~~ ~~Igor is saying this is~~

			~~updated from bitrise, but is bitrise connecting directly with branch?? Otherwise we need to store this in dash~~ • ~~**Branch support email** Edit default dev@intros.at~~

Version 2

Requirement	User Story	Related Tickets	Notes
Mobile App Settings: App Admin can view and edit	**View and Edit:** • Default Event {*Drop down selection}* • Show Download App Banner - *{Toggle}* *Tool Tip: Displays a banner with a URL on the web's edit profile page encouraging the user to download the mobile app* • Default App Banner *{File upload}* *Tool Tip:This image appears on the initial login page. Optimum size for this image is 400 x 200 pixels.* • Home Banner *{show image added in branding}* *Tool Tip: This image will be used to create screenshots for the app stores. PNG or JPEG 1,440 x 600 px* • Sponsor Image {show image added in branding} • Default App Colour *Tool Tip: The hex code required for to style the initial log in page. Required as the user won't have logged into the event at this stage* • App Token {copy} *Tool Tip: set automatically and used as part of the mobile app's configuration*		
Mobile App Store Information: Super Admins: Add and Edit	Add and Edit *(*Edit will require new build to be generated)* • Icon Display Name *Tool Tip:*		Example panda doc :https://app.pandadoc.com/a/#/documents/HVo66tF2ZfyPz8kR5tDuNZ

Max 12 characters including spaces. This is the name that will be displayed underneath the app icon on a user's device Home screen. This is the name that you would search for on your phone if trying to find the app.

- Apple Developer Account Name
  Tool Tip:
  The name of your account could be found under the "Team Name" section on your [Membership Details page](linked). The account name is also displayed in the right top corner of your App Store Connect (in grey font under your first and last name).
- Google Play Developer Account Name
  If the Android app is to be published under Grip's account on the Google Play Store, then you need to type "Grip" in this field. If the Android app is to be published under your account on the Google Play Store, then you need to add exact name of your account in this field.
- Long App Description (iOS and Android)
  Tool Tip:
  Max 4000 characters including spaces. The app description must clearly and accurately describe the app's functionality to guarantee its successful publication on both the App Store and Google Play Store. List only data and functionality that will be present at the time of submission. Do not specify amount of data present (ie. 100's of. exhibitors and products) to avoid rejection based on irregularities. Failing to do this will result in app rejection, which will increase review time by at least 5 additional days.
- Short App Description (Android)
  Tool Tip:

Max 80 characters including spaces

- App Keywords (iOS)
  Tool Tip:
  You should choose keywords based on words you think your audience will use to find the app. Keywords are limited to 100 characters total, with terms separated by commas and no spaces
- Privacy Policy URL
  Tool Tip:
  A URL that links to your privacy policy. A privacy policy is required for all apps. This needs to be an actual URL to Privacy Policy on your website and not PDF link. Apps will be rejected by Google if it doesn't meet this requirement.
- iOS App Icon
  Tool Tip: *PNG, 1,024 x 1,024 px*
- Google Play App Icon
  Tool Tip: *PNG, 512 x 512 px. Note these appear rounded*
- Google Play Feature Graphic

  Tool Tip:
  The Feature Graphic will be used to promote your app in different places on Google Play. If you have a promo video, your feature graphic will be used as the cover image with a Play button overlaid on top. If you do not have a promo video, the feature graphic will not be displayed on your listing. However, a feature graphic is still required by Google Play to publish your app. On the Play store app, Google might show your feature graphic on the homepage in a large format to highlight collections of apps or recommended apps.

  Requirements: *PNG or JPEG, 1,024 x 500 px*

  [Link to an article about feature graphic from Google]

	Google Play icon design specifications (full article on Google Play).		

User interaction and design

- Design decisions belong to the designers. Redundant as it might seem, we saw the need to reinforce this fact.
- Use this section to add links to prototypes, Figma design files, user flows in Miro etc.
- For more complex features/use cases, describe or sketch out the entire user journey.
- Show what the end-to-end experience will be. This could be written prose, a flow diagram, screenshots, or design explorations. It will vary by project and team. Do not try to do this in isolation. Work with design and engineering to complete.
- It is natural for this section to become more specific over time.

-
-

Other requirements

Edge cases and error handling

- Think through all the ways the feature could be (ab)used by users, how it could break, and how we can mitigate the risk. Make sure to discuss this at your 3-amigos/refinement meeting.
- Will this feature be accessible to all users? Are there some users who may encounter different experiences? If so, how will we handle these cases?
- The relevant issues will vary widely depending on the feature but here are some examples questions to consider:
  - Is there a limit on the maximum number of characters/items/actions/events a user can input/perform to avoid performance issues?
  - Have we considered how this feature will behave in different event modes (hybrid, virtual, in-person), with different permissions, or event configuration combinations (e.g. hosted buyer mode) etc?

Please list considerations and requirements for the edge cases below:

Requirement	Related tickets	Version

Mobile

- How will the feature work on the mobile clients? Is there mobile backwards compatibility? Even if it has NO impact, please be explicit about it here (is the feature hidden, what's the UX precisely etc).
- Where possible, include all mobile app related specifications in the same document as the rest of the functionality (feel free to create a separate section with with all the requirements)
- When considering the implementation approach, make sure to involve mobile team for input **before** the development begins.
- Add all the related Jira tickets, other mobile-specific specifications etc in this section

-
-
-

Public APIs

- Consider whether this feature requires changes to the existing public APIs or creation of the new ones.
- Make sure to create (and link here) related Jira tickets (including for updates to the internal and client-facing documentation)
- Where necessary, consult with the integrations team to understand the use cases and requirements for the API design

Requirement	Related Jira Ticket	Version

Dependencies and Risks

- Any team or major technical dependencies or risks should be noted here, and ways to mitigate where relevant
- Do you need to work with other squads or teams?
- Do you require any other work to be completed before you can begin/complete your work?
- Make sure to discuss this at your 3-amigos/refinement meeting and agree on the actions points and timeline.

Dependencies and Risks	Related Jira tickets	Notes

Tracking, Insights and Exports

Success Metrics

- What primary success metrics will we be tracking for this feature internally?
- Start with measuring basic usage of the new feature (modify these metrics to fit your particular feature/use cases):
  - total number of times people are using the feature per day/month/event/team etc.
  - the number of unique users who are using the feature
  - the percentage of your total active users who are using the feature
  - the average number of times per day users are using the feature
- Make sure to create all the related tickets for developers to build the tracking and include it in the technical implementation documents where applicable.
- It is not always possible to establish a causal relationship between feature metrics and higher-level business objectives. Instead, use feature metrics as leading indicators for hoped-for progress against your high-level objectives, e.g. “we hypothesise that active usage of lead scoring feature will lead to higher Exhibitor NPS”.

Metric	Why is this important?	How will we track it?	Related Jira Tickets

Insights & Exports

Which insights, analytics, exports or other data related to this feature should be included in the Grip dashboard and made visible to our customers and dashboard users?

Additional Information

Open Questions

- Include all the open questions and decisions related to this feature including uncertainty around use cases or functional requirements.
- Encourage all stakeholders to contribute at your 3-amigos/refinement meetings.
- Use this information for FAQ section in the support documentation where applicable.

Question	Answer	Date Answered	Asked by

Out of Scope

-

Go to Market Plan

- What is your go-to-market plan for v1? How will you communicate with partners? Is this a premium feature/add-on?
- Involve your PMM and link to another doc if a robust plan is needed.
- What could go wrong with launch and how will you mitigate this risk?

Note	Links	Date added

Results and next steps

- Create a calendar reminder for yourself 1-3 months after the release of v1 to evaluate the feature and add the tracking data to this section of the spec doc.

- How did the feature land? What were the results and how did they vary from your expectations?
- Are there any key learnings or post mortems as a result of this launch?
- Have you checked feature usage data and success metrics in QuickSight?
- What are the next steps?
